Jason Frade

Senior Product Designer | B2B SaaS, Workflow Automation, AI-Assisted Products

Pomfret, CT | jason.a.frade@gmail.com | 781-812-7583 | jasonfrade.com | linkedin.com/in/jasonfrade

Summary

Senior Product Designer with more than a decade designing B2B SaaS, nine at HubSpot, specializing in workflow automation and AI-assisted product experiences. Led design of the Starter Automate panel, where 72% of customer-built workflows used features new to Starter and AI-recommended workflows went live at about twice the rate of those built from scratch. I learn from customers through quick, iterative research.

Experience

HubSpot (customer relationship management software) | Cambridge, MA | Jul 2017 - Oct 2026

Senior Product Designer | Aug 2022 - Oct 2026

Led design for Automation Enablement, which helps customers discover and activate automation inside the customer relationship management (CRM) platform, with a 2026 emphasis on small-business (Starter) customers.

- Defined the product vision and strategy for Embedded Automation, which puts automation on the pages customers already work in, to address automation as the top reason Starter customers churned. Co-authored the vision, product requirements document (PRD), and 2026 strategy that replaced three fragmented automation patterns with one model built on a single Automate button. An A/B test (2x activation, 3x discovery, statistically significant) led leadership to approve Phase 1.
- Led design of the Automate panel, the first release of Embedded Automation: a builder that writes each automation as an editable plain-language sentence for Starter customers. Tested sentence and node-and-canvas builders with customers in Lovable prototypes, built the rulebook and agent skill that write the sentence for every action from its definition, and partnered with engineering on a large language model (LLM) system whose output customers can review and edit. After release to all Starter

customers, 44K portals (more than 1 in 4) clicked Automate and 3,663 workflows were started, 72% of them using automation not available at Starter before. AI-recommended workflows went live at 45% versus 23% when built from scratch, and Starter 30-day activation rose from 60% to 74% over the same period.

- Co-led the vision for and owned the Automation Overview, the home for automation in HubSpot where customers describe what they want to automate and get an AI-drafted workflow to review, alongside a view of which automations need attention. Took it from private beta through Pro and Enterprise launch to a Starter version, shaped by concept tests, an A/B test, and click tests of the new-account experience. Monthly visits grew from about 52K to 150K in a year, with 2M+ views since the May 2025 launch, and 26% of people who described an automation in the AI prompt turned on the workflow it drafted.
- Co-defined the design direction for the Agent Builder Front Door, an onboarding flow that recommends an AI agent to every new Starter buyer, and aligned four teams around a working Lovable prototype to ship it in about 3 weeks. Designed Agents at Starter, where customers run AI agents from the same sentence builder with the underlying workflow visible; about 10K Starter portals visited Agent Hub in two weeks and 127 published an agent.
- Planned and ran a continuous UX research practice (customer interviews, card sorts, tree tests, concept and usability tests, A/B experiments, funnel analysis) that set direction on workflow navigation, reusable actions, the Automation Overview, and embedded automation before engineering investment.
- Expanded automation discovery beyond the blank canvas: workflow templates activated at about 40% versus 25 to 28% for other starting points. Co-drove moving workflow templates into the HubSpot Marketplace as a new product type alongside agents and apps.
- Co-designed Rulesets, a design system that lets other product teams embed automation in their own tools. Inherited the project and partnered with designers on five implementing teams to deliver one consistent contextual automation experience, and built a shared design language and Figma component library with the Automation design team. On the Prospecting agent, one-third of activated portals enrolled an object, for 65K enrollments.
- Led design and research for Action Sets, saved groups of actions that teams reuse across workflows, using discovery calls, a comic strip concept test, and usability testing. Within two months of the December 2023 launch, about 2,400 Operations Hub Enterprise customers used them, 25% of those inserted a set more than 200 times,

and the feature contributed to 106 Enterprise upgrades. Also led the actions panel redesign and custom action builder vision, with an 87% increase in connected apps since October 2023.

Product Designer | Jul 2017 - Aug 2022

- Designed and scaled HubSpot Ads, a journey-based advertising product that connects customers' ad accounts to HubSpot so marketers see the contacts and deals their ads bring in. Customer usage grew from 10% to over 50% of active customers, satisfaction moved from mid-pack to the top of G2 rankings, and attributed revenue increased.
- Built a first-of-its-kind Ads sequencing product that helps marketers plan a complete top-to-bottom funnel strategy across ad platforms.
- Redesigned ad tracking to bring every error into one panel with rewritten, plain-language fix steps, grounded in support ticket analysis, a 224-customer satisfaction survey, and usability testing. Total tracking errors dropped about 50% in the months after release.
- Designed advanced custom-coding tools and third-party extensions that expanded what customers can automate, grounded in customer interviews on Zapier triggers and webhooks.

Kyruus, Lead Product Designer (promoted from Product Designer) | Boston, MA | Sep 2015 - Jul 2017

- Improved how patients are matched with the right doctor across consumer websites and call centers by designing scheduling and provider-matching experiences under the Health Insurance Portability and Accountability Act (HIPAA), and defined the organization's design process.

Hewlett Packard, UX/UI Designer | Sunnyvale, CA | Sep 2014 - Sep 2015

- Built interactive prototypes for cloud automation software and turned user feedback into usable experiences in close collaboration with product and engineering.

XPO Logistics, UX Engineer | Cambridge, MA | Feb 2013 - Sep 2014

- Developed wireframes and prototypes for internal logistics tools and defined the UI guidelines used by a team of 25 developers working in agile.

Education

The New England Institute of Art, BS, Web Design and Interactive Media (concentration in user experience) | 2010 - 2012

Skills

Product Design: UX and UI design, visual design, interaction design, information architecture, systems thinking, technical fluency, design strategy, product vision, requirements definition (PRDs), simplifying complex workflows

UX Research and Data: UX research, customer interviews, concept testing, usability testing, tree testing, card sorting, surveys, A/B testing, funnel and retention analysis, data analysis tools (Amplitude, Hex, Looker)

Design Systems: Design systems, Figma component libraries, shared patterns

AI and Prototyping: Figma, Lovable, Claude, HTML/CSS, rapid prototyping, wireframing, LLM-powered sentence generation, agent skills, AI-powered workflows built on transparency, user control, and trust

Collaboration and Domains: Product, engineering, research, marketing, and data partnerships, stakeholder alignment; workflow automation, marketing automation, advertising, CRM, small-business products, healthcare (HIPAA)
